

Nature-Based Ecological Restoration: Adaptive Management

Keith Underwood, Principal

Regenerative Design & Construction (RSC)

- What is RSC?
 - Ecological Restoration Technique
 - Highly integrated stream and wetland restoration developed in the 1990's;
 - The RSC process began with adaptive management of the ecological restoration literature of that time;
 - RSC is defined as the art of adaptive management to maximize the potential of ecological uplift from design through construction and after;
 - Motivation for developing RSC stemmed from the desire to restore conditions for now rare wetland organisms.

Purple Pitcher Plants (Carnivorous Plants)

Atlantic White Cedar

Listed as a globally threatened
tree species and ecosystem

Spring House Run (National Arboretum)

System of sand and gravel bedded terraces to convert surface flow to ground water and then back to surface flow.

Working With Nature

Time Lapse / Active Monitoring Examples:

<https://vimeo.com/109494413>

<https://vimeo.com/100928979>

<https://vimeo.com/142916226>

- Maintain gravel seeps after installing grade control structures
- Incorporate seeps into the project as added habitat for rare orchids and perennial wetland plants
- Look forward to rain events and actively monitor and photograph sites during storms with time lapse imagery
- Seek opportunities for adaptive management & project improvements during construction

What is Design/Build?

- Design/build is the art of adaptive management;
- Experience, confidence, and knowledge to capitalize on unforeseen opportunities to enhance ecological uplift;
- Same team planning, designing, and constructing the project;
- Reduces design costs (60% plans)
- Provides an integrated solution to restore process

Regenerative Step Pool Storm Conveyance (SPSC) — also known as Coastal Plain Outfalls

Design Guidelines

Home Port Farms - Immediately after

Home Port Farms - One year after construction

Homeport Farms - Six years after construction
