

QUALITY CONTROL

Even though each project is uniquely different from the other, there are some commonalities between them, at completion, that could ensure sustainability of projects.

1. The Contractor and the Project Manager has to ensure that the rocks, if any, have not shifted/displaced moved and is still locked in.
2. The slope of sand-fill is the same as required by the engineer's plan.
3. Elevation of sand and rock are exactly as per the engineering plan.
4. There is no loss of marsh grasses/plants that were planted.
5. All areas disturbed need to be restored to the satisfaction of the owner/agent of the owner.
